fundamentals of human neuropsychology 6th edition: *Translation of Thought to Written Text While Composing* Michel Fayol, M. Denis Alamargot, Virginia Berninger, 2012-05-04

Translation of cognitive representations into written language is one of the most important processes in writing. This volume provides a long-awaited updated overview of the field. The contributors discuss each of the commonly used research methods for studying translation; theorize about the nature of the cognitive and language representations and cognitive/linguistic transformation mechanisms involved in translation during writing; and make the case that translation is a higher-order executive function that is fundamental to the writing process. The book also reviews the application of research to practice -- that is, the translation of the research findings in education and the work-world for individuals who interact with others using written language to communicate ideas. This volume provides a rich resource for student, theorists, and empirical researchers in cognitive psychology, linguistics, and education; and teachers and clinicians who can use the research in their work.

fundamentals of human neuropsychology 6th edition: Thinking about Bribery Philip M. Nichols, Diana C. Robertson, 2017-09-07 Bribery is perhaps the most visible and most frequently studied form of corruption. Very little research, however, examines the individual decision to offer or accept a bribe, or how understanding that decision can help to effectively control bribery. This book brings together research by scholars from a variety of disciplines studying the mind and morality, who use their research to explain how and why decisions regarding participation in bribery are made. It first examines bribery from the perspective of brain structure, then approaches the decision to engage in bribery from a cognitive perspective. It examines the psychological costs imposed on a person who engages in bribery, and studies societal and organizational norms and their impact on bribery. This is an ideal read for scholars and other interested persons studying business ethics, bribery and corruption, corruption control, and the applications of neuroscience in a business environment.

fundamentals of human neuropsychology 6th edition: The Moral Landscape Sam Harris, 2011-06-30 Sam Harris's first book, *The End of Faith*, ignited a worldwide debate about the validity of religion. In the aftermath, Harris discovered that most people - from religious fundamentalists to nonbelieving scientists - agree on one point: science has nothing to say on the subject of human values. Indeed, our failure to address questions of meaning and morality through science has now become the primary justification for religious faith. In this highly controversial book, Sam Harris seeks to link morality to the rest of human knowledge. Defining morality in terms of human and

animal well-being, Harris argues that science can do more than tell how we are; it can, in principle, tell us how we ought to be. In his view, moral relativism is simply false - and comes at an increasing cost to humanity. And the intrusions of religion into the sphere of human values can be finally repelled: for just as there is no such thing as Christian physics or Muslim algebra, there can be no Christian or Muslim morality. Using his expertise in philosophy and neuroscience, along with his experience on the front lines of our 'culture wars', Harris delivers a game-changing book about the future of science and about the real basis of human cooperation.

fundamentals of human neuropsychology 6th edition: Juvenile Delinquency and Disability Kristin C. Thompson, Richard J. Morris, 2016-04-12 This book discusses the relationship between juvenile disability and delinquency, including characteristics of youth with disabilities, how disability relates to delinquency, and its impact during a youth's involvement with the juvenile justice system. The book details the relationship between developmental, cognitive, psychological, and educational disorders—specific conditions including ADHD, bipolar disorder, and autism spectrum disorder—and delinquency in light of both their overrepresentation among youth offenders and the uninformed handling of these youth within the court system. Case studies illustrate the complexities in the processing and placement of these youth offenders, as well as highlight the barriers to delinquent youth receiving appropriate treatment, and their increased risk of reoffending. From this robust knowledge base, the authors make expert recommendations for improving the juvenile justice

system at the practice and policy levels to better serve this population. This authoritative volume:

- Identifies characteristics and risk factors associated with juvenile delinquency.
- Reviews evidence relating developmental, mental health, and other disorders to juvenile offending.
- Describes the implications of disabilities in key areas such as offending, risk assessment, competency, and outcomes.
- Examines the role of disability law in the juvenile justice system.
- Offers guidelines for professionals to use this knowledge in their work.

fundamentals of human neuropsychology 6th edition: Cannabinoid Modulation of Emotion, Memory, and Motivation Patrizia Campolongo, Liana Fattore, 2015-05-18 The endocannabinoid system consists of cannabinoid receptors, their endogenous lipid ligands (endocannabinoids) and the enzymatic machinery for their synthesis and degradation. In the brain, endocannabinoids regulate ion channel activity and neurotransmitter release and thereby contribute to various aspects of brain function, including memory, reward and emotions. Their ability to modulate synaptic efficacy has a wide range of functional consequences and provides unique therapeutic possibilities. Unprecedented advances have been made in the understanding of the role of endocannabinoids in the regulation of the emotional brain over the past few years. However, a comprehensive book encompassing all these aspects is still lacking. The book will provide an overview of the role played by the endocannabinoid system in the regulation of emotional processes with particular emphasis on the modulation of memory and reward for emotionally arousing events and for the regulation of motivational aspects in cannabis use.

fundamentals of human neuropsychology 6th edition: The Amygdala Barbara Ferry, 2012-12-19 Among the components of the limbic system, the amygdala is a fascinating structure that is involved in the processes of liking and disliking and in the ways our emotions drive our actions and affect the strength of our memories. Combined with new conceptual breakthroughs, the very latest data obtained by leading world experts in amygdala function that are reviewed in this book have helped to understand how the amygdala contribute to these processes and also to a variety of neurological and neuropsychiatric pathologies. Of course, due to the rate of research advancement, all the chapters presented here correspond to precise questions addressed by experts using highly specific techniques. Therefore, each chapter should be viewed as pieces of a puzzle that represent all the different research areas that have to be taken into consideration in discussing the role of the amygdala in emotion and memory. Although the primary goal of this book is to inform experts and newcomers of some of the latest data in the field of brain structures involved in mechanisms
