california institute of technology computer science masters: Technologies in the Era of Singularity Guru Pada Chattopadhyay, 2018-05-28 When young, we didn't have cellular devices but communicated through handwritten letter. We walked miles to school, in the sun and the rain. It's

mind-boggling to think how far we've come technologically. "Objects in mirror are closer than they appear." That familiar warning applies to the windshield, not the rear view mirror when it comes to technology. And in case of exponential technologies, almost everything is closer than it appears. Today's students will be graduating in and around 2030. Over 65% of the jobs of that time have not been invented yet. What knowledge, skills and dispositions will our learners need for a successful future? How will exponential changes in technology influence them? How can they shape the future instead of being shaped by it? There is an urgent need to be aware of exponential technologies which will usher in singularity, a point in time when artificial intelligence will equal and then surpass biological intelligence. An exploratory design of medical nanotechnology and robotics is creating mechanical artificial red blood cells, called respirocytes, which will deliver 236 times more oxygen to the tissues per unit volume. One can then do an Olympic sprint in fifteen minutes without taking a breath. Earth is awash with the sun's rays carrying 10,000 times more energy than we need but we cannot harness it. In a foreseeable future, highly efficient, lightweight, nano-engineered solar panels will be able to store solar energy in distributed nanotechnology-based fuel cells. In the field of health, we are going to have tools to reprogram biology to block diseases and delay aging. We need our future scientists and engineers to be wholesome human beings with the ability to think critically and pay heed to the moral and ethical issues of future technologies. Notwithstanding these issues, all great technological breakthroughs are absolutely necessary to alleviate poverty, disease, suffering and create abundance.

california institute of technology computer science masters: Visual Computing Tosiyasu L. Kunii, 2013-04-17 This volume presents the proceedings of the 10th International Conference of the Computer Graphics Society, CG International '92, Visual Computing - Integrating Computer Graphics with Computer Vision -, held at Kogakuin University, Tokyo in Japan from June 22-26,1992. Since its foundation in 1983, this conference has continued to attract high quality research articles in all aspects of computer graphics and its applications. Previous conferences in this series were held in Japan (1983-1987), in Switzerland (1988), in the United Kingdom (1989), in Singapore (1990), and in the United States of America (1991). Future CG International conferences are planned in Switzerland (1993), in Australia (1994), and in the United Kingdom (1995). It has been the editor's dream to research the integration of computer graphics with computer vision through data structures. The conference the editor put together in Los Angeles in 1975 involving the UCLA and IEEE Computer Societies had to spell out these three areas explicitly in the conference title, computer graphics, pattern recognition and data structures, as well as in the title of the proceedings published by IEEE Computer Society Press. In 1985, the editor gave the name visual computer to machines having all the three functionalities as seen in the journal under that name from Springer. Finally, the research in integrating visual information processing has now reached reality as seen in

this proceedings of CG International '92. Chapters on virtual reality, and on tools and environments provide examples.
